

A caregiver's voice-first journal — for your patient's next visit

What Care Chronicle is, why your patients use it, and how it helps you deliver better care in less time.

What it is

A private journal your patient's caregiver keeps by voice. They speak a sentence — symptoms, meds, appointments, moods — and AI turns it into a searchable, dated timeline.

Why it matters to you

Instead of vague recall (“he’s been off lately”), the caregiver arrives with a timestamped history, current medications, and answers to your questions in seconds.

What you'll see in the exam room

- **Chronological timeline.** Every entry dated. “When did the cough start?” is answered in one tap.
- **Current medication list.** Name, dose, schedule, changes over time — kept up to date at home, not reconstructed from memory.
- **Symptom & behavior patterns.** AI surfaces trends (sleep, appetite, pain, sundowning) across weeks, not just today.
- **Ask-anything search.** The caregiver presses record and asks — “what dose did we use in March?” — and gets a cited answer from their own notes.

How the caregiver shares with you

1. Caregiver generates a secure link

From their Care Chronicle app, scoped to one patient.

2. You open it in any browser

No account, no install. Timeline, meds, and notes appear.

3. Print or save as PDF

Attach to the chart. Link can be revoked anytime.

Privacy & control

Data belongs to the caregiver. Shares are link-based, patient-scoped, and revocable. No data is sold. Not a medical device; complements — not replaces — your records.

Who it helps most

Dementia & Alzheimer's care, complex chronic illness, post-hospital recovery, special-needs children, and anyone juggling multiple specialists or medications.

If this would help your patients

Tell caregivers: “There's a free app called Care Chronicle where you can voice-journal what's happening at home and share a timeline with me before visits.”
